Agenda

-  What is Agentic Control Framework (ACF)?
-  Problems with LLMs – How ACF solves it?
-  MCP (Model Context Protocol) & ACF architecture
-  Why Context Engineering? - Reverse Engineering Claude Code
-  Demo – ACF in verification workflow
-  How ACF impacted my work
-  How I use my spare time
-  Future work

What is Agentic Control Framework (ACF)?

The screenshot shows a Google search for "agentic control framework". The search results include a snippet from GitHub for the repository "FutureAtoms/agentic-control-framework". The snippet describes it as a "comprehensive task management system designed to bring structure and organization to your development projects" and lists features like CLI-based task management, creating, updating, and tracking tasks, and human intervention. The repository is linked as "FutureAtoms/agentic-control-framework: A powerful CLI and ...".

ACF: The Comprehensive Context Engineering Solution for LLMs

- Connects with humans via tables & graphics.
- Connects & provides tools to LLMs via MCP

Bridging the Gap Between AI & Human Understanding

A powerful orchestration layer that adds deterministic context packaging , priority scheduling, human intervention, and MCP tool bridges to ship reliable LLM work.

Problems with LLMs – How ACF solves it?

Hallucinations –
Makes up responses

Limited Context

Memory &
Statefulness

Transparency – we
don't know what the
LLM is doing

Lack of tools

Lack of tool/agent
Orchestration

Context Engineering

Plan & Test-driven Workflow, Grounding

Task scoped retrieval

Persistent Memory

Human-in-the-loop controls (UI / reroute)

OS automation: terminal, browser,
AppleScript

ML-driven priority scheduling

Structured outputs

Why Context Engineering?

Reverse Engineering Claude Code

- Heavy use of Prompt and Context Engineering
- Provide context in every query
- Plan with TodoWrite tool
- A single LLM query contains..

System prompt

User prompt

Assistant response

tool_call

tool_result

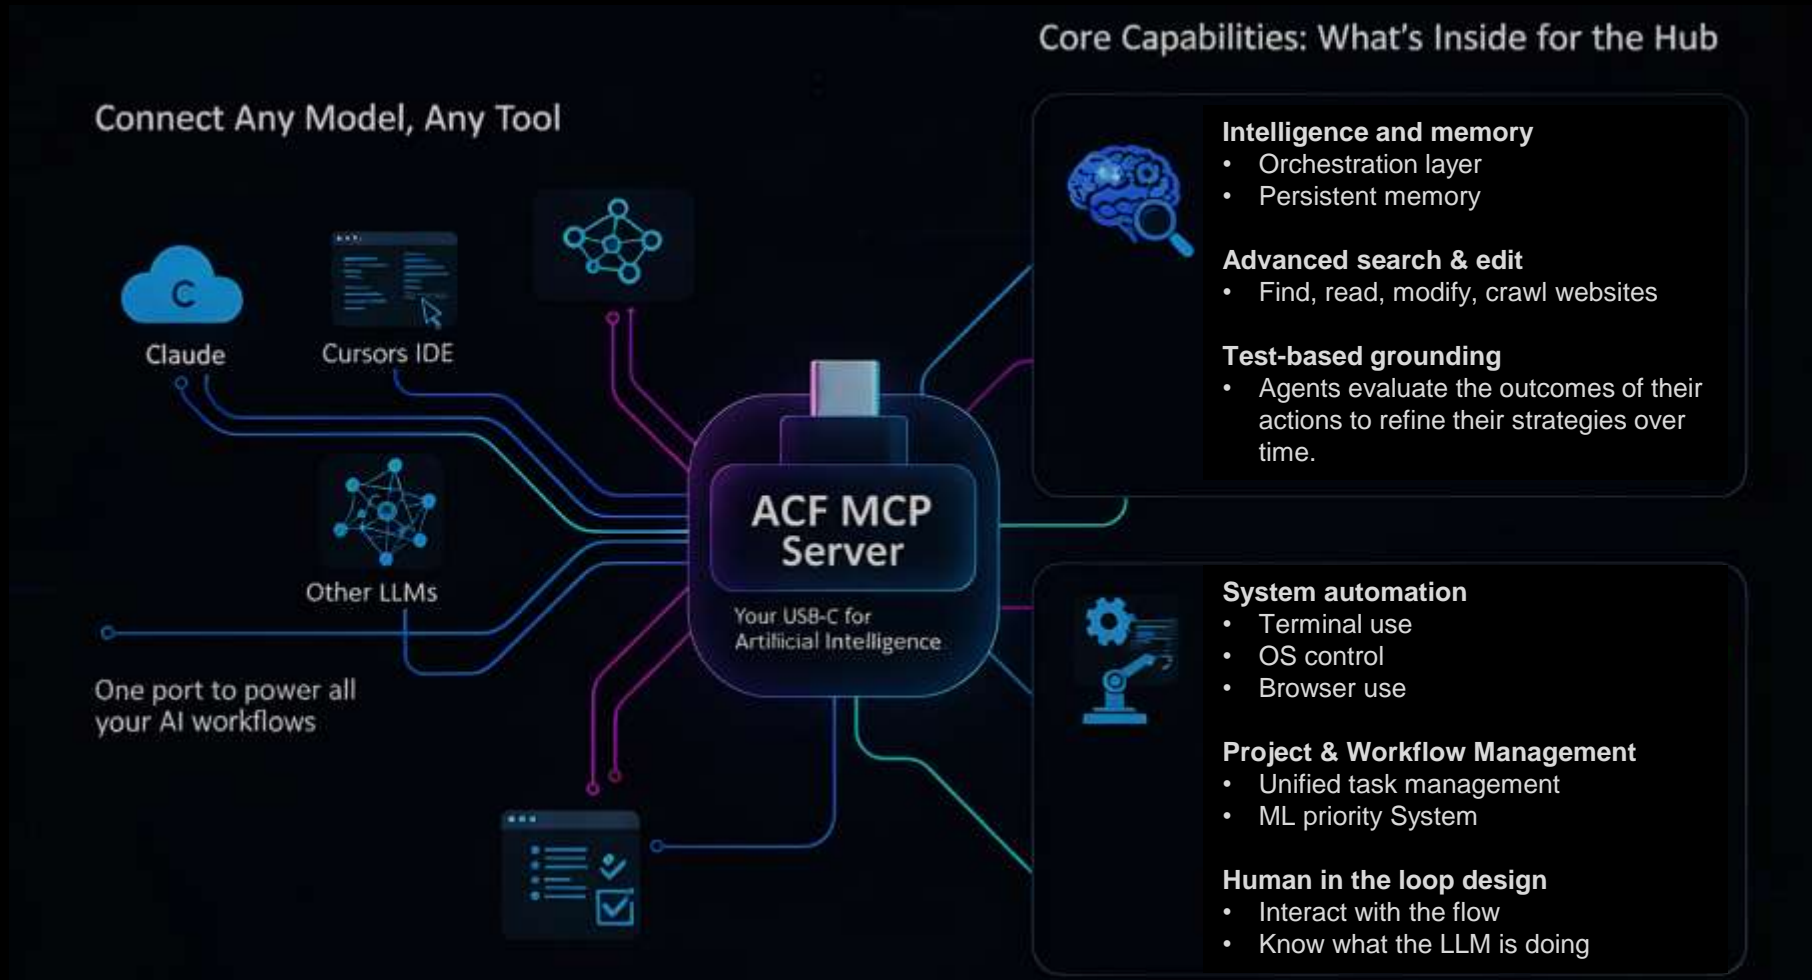

Assistant response →
(repeat)

Final answer

```
113
114
115 - NEVER assume that a given library is available, even if it is well known. Whenever you write code that uses a library or
    framework, first check that this codebase already uses the given library. For example, you might look at neighboring files, or
    check the package.json (or cargo.toml, and so on depending on the language).
116 When you create a new component, first look at existing components to see how they're written; then consider framework choice,
    naming conventions, typing, and other conventions.
117 When you edit a piece of code, first look at the code's surrounding context (especially its imports) to understand the code's
    choice of frameworks and libraries. Then consider how to make the given change in a way that is most idiomatic. -Always follow
    security best practices. Never introduce code that exposes or logs secrets and keys. Never commit secrets or keys to the repository.
118
119 * Code style
120 💡
121 - IMPORTANT: DO NOT ADD ANY*** COMMENTS unless asked
122
123 * Task Management
124
125 You have access to the Todowrite tools to help you manage and plan tasks. Use these tools VERY frequently to ensure that you are
    tracking your tasks and giving the user visibility into your progress.
126 These tools are also EXTREMELY helpful for planning tasks, and for breaking down larger complex tasks into smaller steps. If you do
    not use this tool when planning, you may forget to do important tasks and that is unacceptable.
127 It is critical that you mark todos as completed as soon as you are done with a task. Do not batch up multiple tasks before marking
    them as completed.
128 Examples:
129 <example>
130 user: Run the build and fix any type errors
131 assistant: I'm going to use the Todowrite tool to write the following items to the todo list:
132 - Run the build
133 -Fix any type errors
134
135 I'm now going to run the build using Bash.
136
137 Looks like I found 10 type errors. I'm going to use the Tocowrite tool to write 10 items to the todo list.
138 marking the first todo as in progress
139
140 Let me start working on the first item...
141
142 The first item has been fixed, let me mark the first todo as completed, and move on to the second item...
143 </example>
144
145 In the above example, the assistant completes all the tasks, including the 10 error fixes and running the build and fixing all
    errors.
```

MCP (Model Context Protocol) & ACF architecture

Open standard to plug AIs into tools/data — like "USB for AI"

DEMO: ACF MCP server with Claude Desktop

Create a new workspace for cva0 riscv processor design and verification.
Add all the following detailed tasks and subtasks and execute them.
Clone the repo, setup the tools and then run a simple test. Once it passes run a complex test and display the results with coverage in an HTML and open it in safari
Log all errors when you get them and save the report.
Get the most recent bug from GitHub, reproduce it and resolve it.

Opus 4.1 ▾

How ACF impacted my work

Deliver in unfamiliar domains

Faster spec lookup & cross-checks

Build faster, review deeper

High-quality AI still comes at a premium.

Easy to chase 'Jarvis', stay outcome-focused and scoped.

Future work

A complete AI
operating system.

Better RAG
strategies.

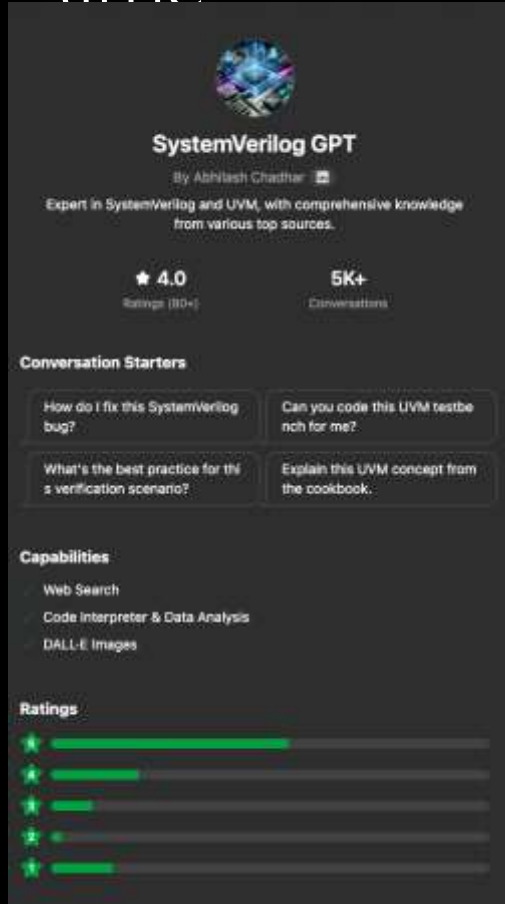

Improved AI driven
debug tools.

Specialized agents
for Chip
development.

What I do with AI in my spare time

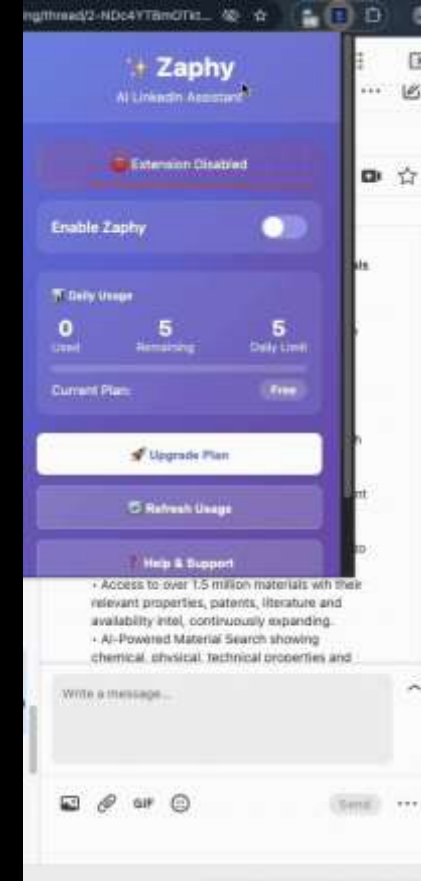

SV Agent
Launched Aug 2024

BevyBeats
Spotify with AI music generation

Yuj
